

Four conditions of an Asimov Cascade: a swing-range mismatch

CONDITION	1	2	3	4
	C1 LOCAL CORRECTNESS	C2 INTERFACE MISMATCH	C3 DOWNSTREAM PROPAGATION	C4 UNSAFE TRAJECTORY
	Punch control and safety monitor both operate within their assigned limits.	The monitor assumes a shorter swing than the controller's permitted impulse can produce.	The actual swing exceeds the predicted envelope and carries the deviation downstream.	The longer swing reaches the stationary researcher; exposure turns the trajectory into injury.
	 PUNCH + MONITOR: LOCAL PASS	 PREDICTED SWING STOPS SHORT	 ACTUAL SWING > PREDICTION	 UNSAFE TRAJECTORY + EXPOSURE

LOCAL CORRECTNESS → INTERFACE MISMATCH → PROPAGATION → UNSAFE TRAJECTORY
