

A Ordered-propagation count per cell (C1; delay 0 ms = matched C0 baseline)

F1. Controlled 1-D simulation, 50 frozen seeds per cell. A cell counts a trial only if the frozen strict event order held with all local contracts passing (PROPAGATED). Large-delay breaches that precede the delayed trigger violate the order rule and are NOT counted here (reported separately as unordered breaches). Simulation results only; not evidence about real robots.
