

F2. Synchronized matched trio at the same frozen seed (speed 0.45 m/s, seed 2029), selected by the frozen median rule (median-propagation-count C1 cell; lower-median minimum-margin trial; same seed for C0/C1/C4). The selected mismatch trial's frozen label is BREACH_UNORDERED: at 200 ms the margin breach begins before the delayed safety trigger, so the strict event order is not met and this cell counts zero propagations — ordered propagation concentrates at intermediate delays (see F1). The rescue panel stops almost immediately because every delayed sample violates the 25 ms age gate — that is the preregistered conservative-stop design, not a tuned outcome. Synthetic simulation traces.
