

A All five local contracts pass except in C3
(component fault fails perception contract by construction)

B Matched rescue eliminates propagation wherever it occurred
(all C4 trials contained; shown for cells with parent propagation)

F4. Left: fraction of trials passing all five local contracts per condition. Right: paired risk difference between each mismatch parent and its matched rescue (same seed, same physics), cells with zero parent propagation omitted (RD = 0 exactly). Simulation results; rescue effectiveness is a property of this modeled interface, not of any real robot.
